

Fully Operational Features

-User Login : Users login through Google utilizing Google OAuth for user authentication. After login, check if user id has registered username in database and proceed to the home page or registration based on the result.

-User Registration : Users can register by inputting a unique username. If the username exists in the database already, then an error is displayed. If the username does not exist in the database, create a new user in the database.

-Post Creation : Logged in users can create new posts and new posts are inserted in the posts table inside the database.

-Post Likes : Users can like posts and posts like count gets incremented inside the database.

-Post Deletion : Users can delete their own posts and posts are deleted from the database.

-Sort Posts : Users can choose how they want to sort posts with a dropdown menu. Queries are sent to the database based on how the user wants to sort the posts and post order is updated based on the chosen option.

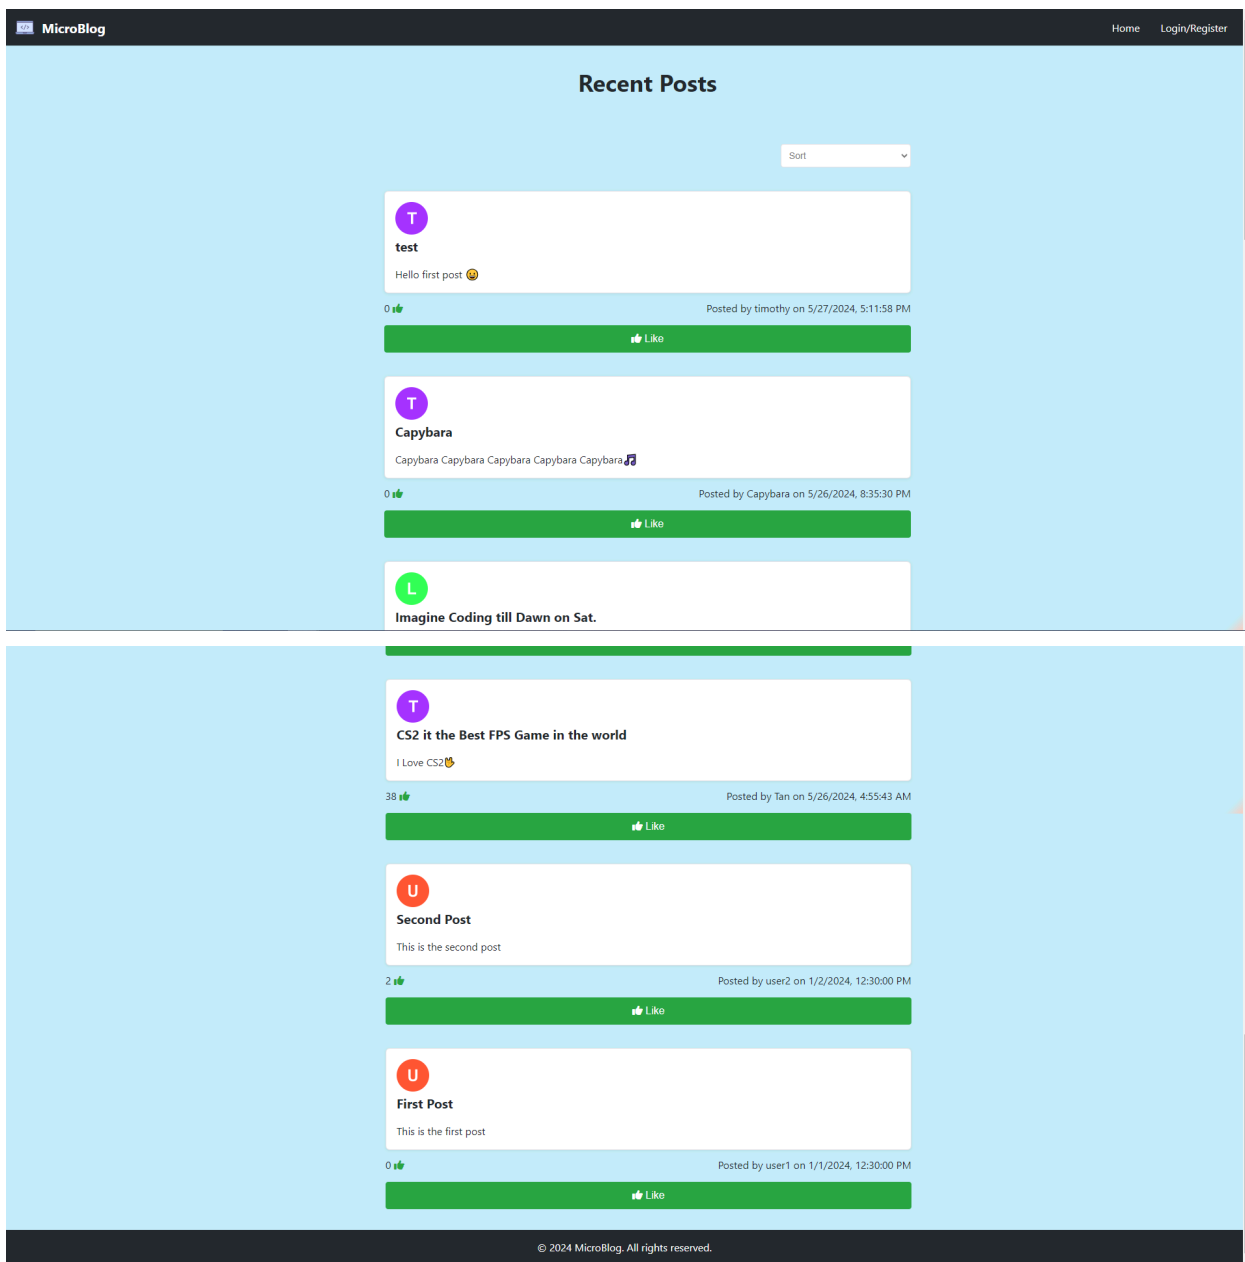

-Environment Variables : Store emoji API key, OAuth client key and client secret in a .env file for better security.

Features Under Development

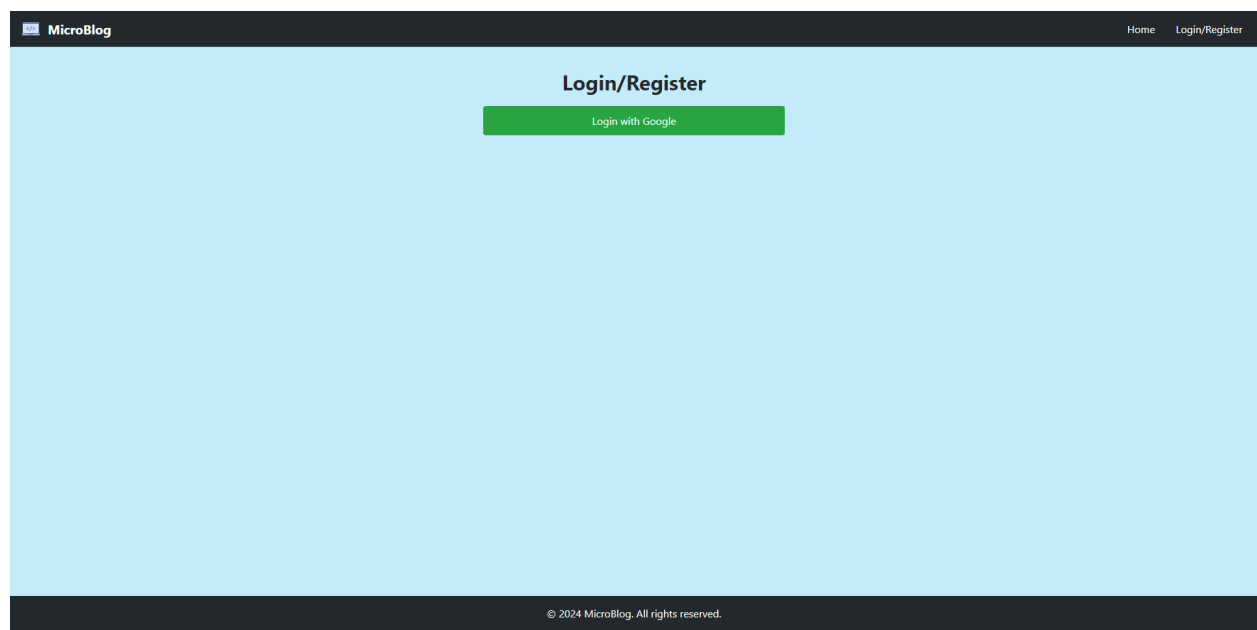

-CSS : CSS is bland and will be updated to follow a certain theme and target a certain audience
